

billing

Finys billing is state-of-the-art, web based, highly configurable module that is built to service carrier's clients.

Billing is one of the most important part of the relationship between the carrier and the client. Information available in the billing system plays a key role in servicing customers. The flexibility built in the Finys billing system allows for customization of the information based on the user privileges to perform better client servicing.

The integration with third party interfaces such as the credit card payment gateways, ACH and EFT processing; and the flexibility in producing payment plans allows for the system to be implemented in a short period of time improving the speed to market for new and existing product lines.

The billing process integrates with the

Finys' as well as third party policy management modules allowing for a straight through processing for new business, renewals as well as amendment processing.

Finys insurance product suite is developed using .NET framework for the thin client web browser deployment, allowing for ease of hot fixes and upgrades. The Service Oriented Architecture (SOA) facilitates interoperability between modules.

With simple still effective features written using leading edge technology, the Finys rating engine provides a highly maintainable system with superior performance for the underwriters and business users.

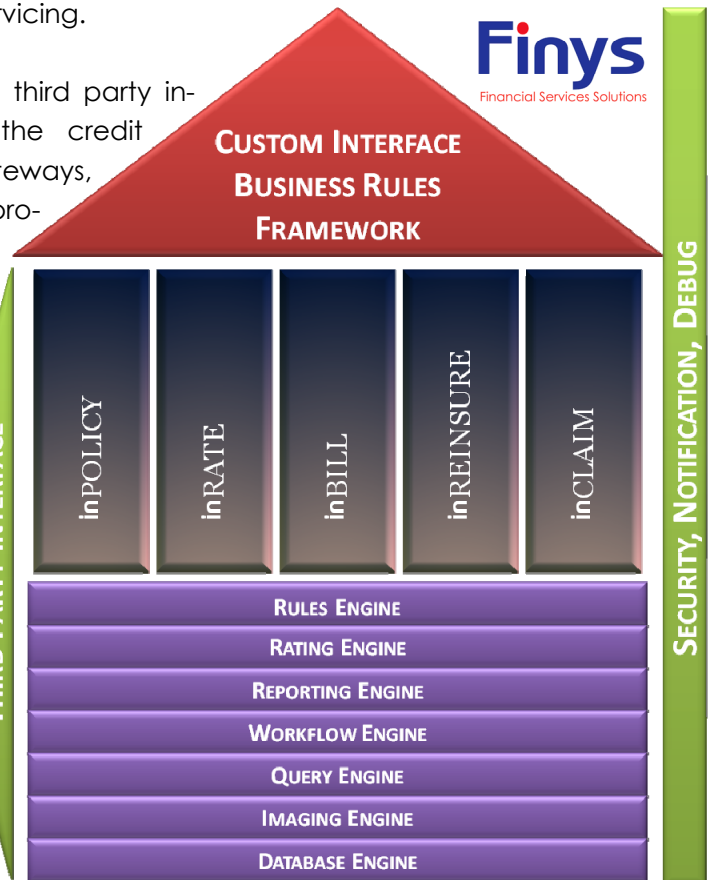

simplified billing and payment processing

highly secure, web based platform

reduced problem resolution time by immediate access to information

integration with third-party payment gateway

ease of use thru greater flexibility for agents and call centers

property & casualty

com•pli•ant

produced in accordance with a specified body of rules

Finys Property & Casualty suite has revolutionized the implementation of business change in IT systems. The web based, fully integrated, modular suite with superior operational and financial controls lends itself towards improving operational efficiency and improving time to market in the ever changing insurance world. The dynamic workflow engine in the suite enables creation of workflows for straight through processing of all operations. This framework based suite can quickly deploy new commercial and personal business lines without impacting existing implementation. The suite is well integrated with industry standard third party service providers for bidirectional data feeds. The suite and the modules are available out-of-a-box to be implemented in-house or as hosted Software as a Service (SaaS).
